

NON-CUSTODIAL PAYMENTS

A payment request that settles on-chain.

Create an invoice. Pay the exact amount. Verify the receipt on Avalanche.

AVALANCHE FUJI

OPEN SOURCE

0.01 AVAX TESTNET PROOF

Payments without an intermediate platform balance.

AN ILLUSTRATIVE USER SCENARIO

Getting paid should not mean giving up the receipt.

A freelance Web3 contributor finishes a delivery and needs a precise payment request. The client wants a receipt both sides can inspect.

01 Request clarity

A shareable request carries an exact amount and a clear payment target.

02 Settlement confidence

Both parties can inspect the on-chain result, not only a platform status.

03 Less custody

Funds forward to the creator in the payment transaction; no platform balance is held between transactions.

FOCUSED PAYMENT REQUEST + RECEIPT | NO MARKET-SIZE CLAIMS

A DIRECT PATH FROM REQUEST TO RECEIPT

One contract call. One verifiable settlement.

CHECKS-EFFECTS-INTERACTIONS

State updates before transfer. If the recipient transfer fails, the whole transaction reverts.

RECORDED FUJI TESTNET WALKTHROUGH

A receipt you can
open and inspect.

Invoice #1 | 0.01 AVAX | Avalanche Fuji C-Chain (43113). Hashes are provided for independent inspection; this deck does not claim an independent explorer re-check.

PROOF BOUNDARY

The published walkthrough used the same funded test wallet as creator and payer. It documents the contract flow, not independent two-user adoption or real revenue.

SOURCE CODE ON GITHUB

RECORDED DEMO VIDEO | FALLBACK

RECORDED VIDEO IS A FALLBACK, NOT A LIVE SESSION.

HONEST SCOPE | CLEAR NEXT STEP

A focused prototype.

Ready for a two-wallet test.

Next: validate the creator-to-payer journey with two independent wallets, then test usability and operational safeguards. The published demo is a single-wallet flow.
